

Global Vendor Programs Without Fragmentation

Multi-ERP environments and cross-border compliance requirements demand more than a single-region TPRM platform

The Challenge

Global manufacturing and enterprise organizations running multiple ERPs face a vendor governance gap that no spreadsheet resolves. Each ERP has its own vendor master, its own data standards, and its own compliance fields for local tax and regulatory requirements. The result is a fragmented view of the same vendor base.

When a team in Germany onboards a vendor registered in Brazil without country-specific guidance, the wrong tax fields get completed, compliance documentation is missing, and the error only surfaces at audit.

Where Programs Get Stuck

Duplicate vendor records across ERPs

The same vendor exists in three systems with three slightly different profiles. Finance and procurement in different divisions may not know they share a supplier.

Country compliance done manually

Staff onboarding vendors in unfamiliar geographies must know local tax field requirements and regulatory documents. Errors are common and caught late.

Each ERP integration is a separate project

Point-to-point ERP integrations are expensive to build and maintain. Adding a new division or region requires engineering work rather than configuration.

What ComplyScore® Changes

ComplyScore® integrates with SAP, Oracle, JD Edwards, Infor LN, and other ERP systems through an API-first architecture. Vendor data synchronizes bidirectionally without historical data migration. When a user registers a vendor from Brazil, country-specific tax fields, documentation requirements, and compliance checks appear automatically based on the vendor's registered address. Implementation proceeds division by division, so the first division goes live while others are still onboarding.

Without ComplyScore®	With ComplyScore®
Vendor master fragmented across Oracle, JD Edwards, and Infor LN with no unified view	Single ComplyScore® record synchronizes across all connected ERP systems via API; deduplication built in
Country-specific compliance fields and documentation completed manually by staff	Country localization auto-presents correct tax fields and regulatory requirements based on vendor address
Big-bang ERP implementation required to launch; high project risk	Phased rollout by division; first division live while remaining ERPs are configured in parallel
Role-based access requires manual configuration when staff change regions	Active Directory integration manages user access automatically; LBU segmentation limits visibility by division

Key Capabilities

API-first ERP integration

Bidirectional sync with SAP, Oracle, JD Edwards, Infor LN, and 4,000+ applications; no historical data migration required.

Auto-contextual country localization

Tax fields, compliance documentation requirements, and regulatory checks are presented automatically based on vendor location.

Phased division-by-division rollout

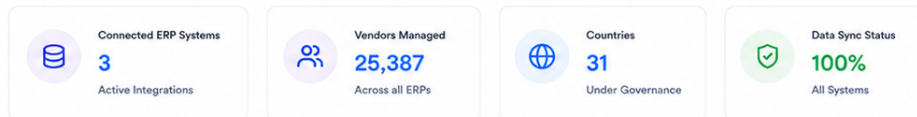

Each business division goes live independently, reducing implementation risk and delivering faster time to value.

LBU access segmentation

Role-based access controls ensure each business unit sees only its own vendor submissions while global governance maintains a consolidated view.
